

If your AI went dark for 4 hours, **what would stop?**

Sept 3, 2026: ChatGPT, Claude, and Grok all had outages the same morning.

Jason Redfoot · Founder, Pragentic.ai

- 01 Map your AI dependencies
- 02 Rank by blast radius
- 03 Keep a manual path
- 04 Don't single-source critical work
- 05 Watch the status pages

WHAT HAPPENED

One morning. Three outages.

- 9:23 AM Claude: elevated errors
- 9:30 AM Grok: full outage
- 10:43 AM ChatGPT: routing error
- 11:17 AM ChatGPT: resolved
- 12:16 PM Claude: resolved
- 1:05 PM Grok: restored, ~3.5 hrs later

Times ET. No shared cause was pointed to.

For most people: an annoying morning.

For a business with AI wired into intake, quoting, or customer replies, work stopped. Or it kept going with nobody noticing the AI step had failed.

Which of your workflows would you hear about last?

01

Map your AI dependencies

List every workflow that calls an AI tool: intake, quoting, support replies, scheduling, reporting.

Try this: one spreadsheet column. “Uses AI? Which tool?”

02

Rank by blast radius

Separate what breaks for customers from what just slows your staff down.

Plan for the customer list first.

03

Keep a manual path

A written fallback for every customer-facing AI step. Test it once a quarter.

A plan nobody has run isn't a plan.

04

Don't single-source critical work

Line up a second model or vendor for the workflows that can't wait.

Try this: test the backup on one real task before you need it.

05

Watch the status pages

Subscribe to vendor status alerts so
you hear first, not your customers.

Try this: route alerts to a shared inbox, not one
person.

Sept 3 was a free fire drill. The next one might not be.
