

When AI gets it wrong, who takes the blame?

For claims adjusters, it was the human who passed the answer along. A 5-step check so a person always holds the keys.

Jason Redfoot · Founder, Pragentic.ai

- 01 Draft or decide?
- 02 Build the override
- 03 Sample the output
- 04 Own the error
- 05 Roll out with the team

SWIPE →

WHAT HAPPENED

98%

When claims adjusters mention AI in their Glassdoor reviews, they're critical of it 98% of the time.

- Misclassified claims flooding intake
- Hallucinated details in claim summaries
- The human who relayed them took the heat

Glassdoor research, via WIRED, Aug 31, 2026. Counts reviews that mention AI.

“AI is just a tool. It should never be given the keys.”

Geoffrey Conrad, claims executive, via WIRED

Push AI at a team instead of building it with them, and you pay twice: errors that reach customers, and staff who stop trusting the tools.

01

Draft or decide?

Sort every AI task: AI drafts and a human decides, or AI decides and a human audits.

Nothing goes in the “nobody checks” bucket.

02

Build the override

Staff can correct or reroute AI output in one step, not a support ticket.

Try this: ask who uses it daily what they quietly fix.

03

Sample the output

Review a fixed share of AI work every week. Errors you catch cost less than errors customers catch.

Try this: 10 items, same day, every week.

04

Own the error

When AI gets it wrong, the business owns it. Not the employee who passed it along.

Say it before rollout, not after the first mistake.

05

Roll out with the team

Pilot with the people who'll use it.

Their objections are your risk register.

A person always holds the keys.

- ☐ Draft or decide
- ☐ One-step override
- ☐ Weekly sample
- ☐ Business owns errors
- ☐ Team-led rollout
